Regarding claims 10-21, Iwasita discloses that An automatic programming method of positioning a product model in a work model, and determining a machining area based on a state of positioning the product model, the automatic programming method comprising: a first processing including detecting a turning surface having a largest diameter in the product model (column 2, lines 46-50; Fig. 3); and determining a central axis of rotation on the turning surface detected as a turning axis of the product model (column 4, lines 45-54, column 3, lines 23-28); a second processing including shifting or rotating the product model so that the turning axis of the product model determined matches a turning axis of the work model (column 5, lines 24-31); and a third processing including shifting the product model so that an end face of the product model shifted at the second processing matches a program origin preset in the work model (Fig. 1); a fourth processing including reversing a direction of the product model by 180 degrees with a central position of the product model in a direction of the turning axis as a center (Fig. 6A-6C); a part of the turning surface is missing, the first
